

Instagram Engagement Analysis Strategy Document

Project Objective

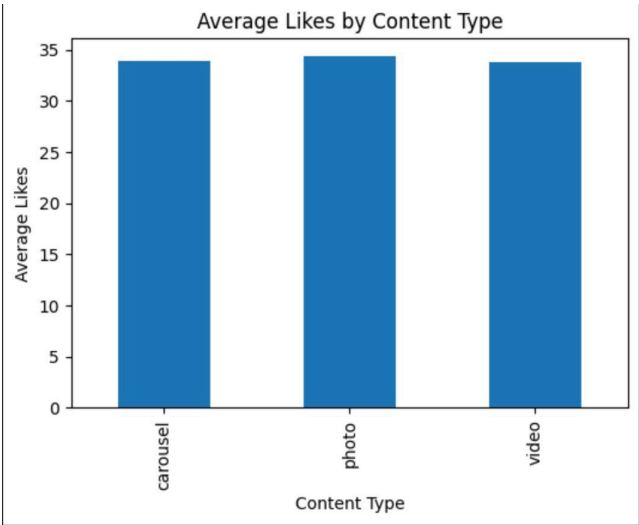

The objective of this project was to analyze Instagram engagement data to identify patterns in content performance, hashtag usage, follower trends, and user engagement. Based on these insights, recommendations were developed to help Alfido Tech improve its Instagram content strategy.

Dataset Overview

- Source: Kaggle (Instagram Dataset)
- Users: 100
- Posts: 257
- Likes: 8,782
- Comments: 7,488
- Hashtags: 21

Key Findings

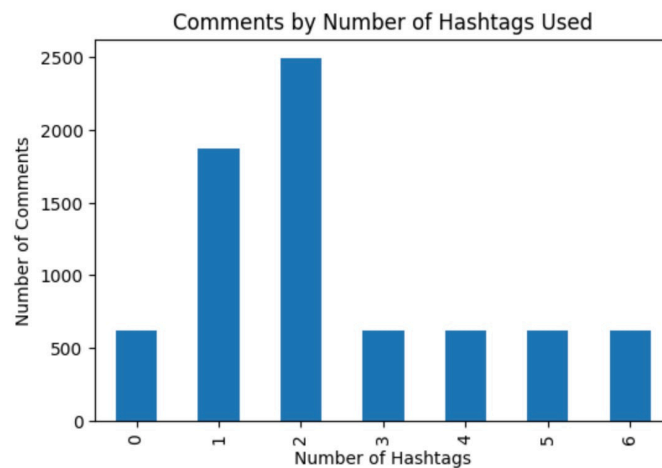

- Photos were the most frequently shared content type.
- Photo posts received slightly higher average likes than videos and carousel posts.
- Posts using two hashtags generated the highest number of comments.
- Most posts used Instagram filters.
- Follower distribution was relatively balanced across users.

Recommendations for Alfido Tech

- Prioritize high-quality photo content to maximize engagement.
- Use approximately two relevant hashtags per post.
- Apply Instagram filters where appropriate to improve visual appeal.

- **Maintain a consistent posting schedule and monitor engagement regularly.**
- **Use real-world Instagram analytics to refine future content strategies.**

Limitations

- **All posts in the dataset have the same timestamp (8:04 AM), so the best posting time could not be determined.**
- **The dataset appears to be synthetic; therefore, the findings should be interpreted within the context of this dataset.**

Conclusion

The analysis provided valuable insights into Instagram engagement patterns and highlighted practical strategies that can support social media decision-making. While the dataset has limitations, the project demonstrates the use of data analysis techniques to generate actionable recommendations for improving Instagram engagement.
